

Anchor bolt and cable drilling rig rock drill

What are core drill anchoring bolts & fasteners?

These core drill anchoring bolts and fasteners can be used with a range of core drill rigs and stands. Available as a complete set with lock nut, washer, threaded bolt and anchor or as sets of 20 anchors. Easy to install and can be used in a range of surfaces such as concrete, masonry, stone and asphalt.

What is anchor drilling?

Anchor drilling is a special process in which anchors are installed in order to stabilize walls or slopes. An anchor is a structural component, which carries tractive forces to the ground, the slope or the rock. These forces occur during foundation engineering.

What is a self-drilling rock bolt?

A self-drilling rock bolt, also known as a self-drilling anchor system, is an advanced rock reinforcement solution designed for efficient ground stabilization in tunneling, mining, and slope protection. Featuring a hollow steel bar with a sacrificial drill bit, it enables simultaneous drilling and grouting without needing a pre-drilled hole.

How many strands can a cable Bolter install?

The bolter can install up to 25 meter long cable bolts with several steel strands per hole and has an onboard automatic cement mixer and cement silo. This cable bolter is designed for safety, with the bolting process performed by a single operator situated away from the drilling, grouting and cable installing module.

What is a sacrificial drill bit?

Featuring a hollow steel bar with a sacrificial drill bit, it enables simultaneous drilling and grouting without needing a pre-drilled hole. This integration enhances installation speed and structural reliability, particularly effective in challenging geological conditions.
