What is a bypass in oil & gas drilling?

A bypass is installed in such cases to permit passage of fluid through the bypass line while adjustments or repairs are made on the control that is bypassed. Source: API RP 54, Recommended Practice for Occupational Safety for Oil and Gas Well Drilling and Servicing Operations, Third Edition, August 1999 (2007). Global Standards .

How deep can a drilling tool be activated?

The tool has achieved activations at depths of more than 31,000 feet, hot holes of up to 250 °C, heavy mud weights of up to 20 PPG, and has been activated at up to 98 ° inclination. 20+ application types in drilling, completion, P&A. Largely immune to variations in angle, temperature, differential pressure, mud type & mud weight.

What is a drill sub?

Specifically, the sub establishes communication between the fluids in the drillpipe and pressure and fluid flow in the drillstring. The sub is typically run above the WELL PATROLLER validation tool to provide an additional means of equalizing pressure and fluid flow around the tool should it fill with debris while pulling out of hole.

What is a bypass valve?

Usually refers to a pipe connection around a valve or other control mechanism. A bypass is installed in such cases to permit passage of fluid through the bypass line while adjustments or repairs are made on the control that is bypassed.

What is a bicobeast drill motor?

The BICOBEAST is BICO's premier line of downhole drilling motors. It is specifically designed to drill faster and longer intervals while performing in harsh drilling conditions.

What is Autolock on a PBL drill?

The Autolock option allows for pulling a dry workstring or filling the drillstring while tripping in the hole. It also provides an option to reverse circulate if necessary. The PBL can cycle numerous times in a single trip. The ball-shearing pressure can be set to the operator's preference.
