How do you use a DTH drill?

Thrust should be kept as low as possible at all times to avoid excessive vibration in the drill string. Hold back should be increased more and more as additional rods are added and as drilling progresses. DTH drilling is primarily percussive drilling using the energy imparted by the hammer piston to the rock through the bit.

How do you lubricate a hammer drill rig?

line oil into the hammer. When attached to drill rig, blow air through to ensure all internal parts are lubricated. Operate at low pressure initially. Progressively increasing, during the first hour, in hammer. Compression Spring If applicable remove compression spring from cylinder. Ensure that eye protection is worn when remov

How should a drill hammer be adjusted?

Proper adjustment ensures prevention of part damage and correct hammer operation. On occasion, excess oil will drain down the drill rods into the hammer when it is not in use, and may demand a cleaning of the parts. Also, when using the hammer in cold and wet conditions, place it as far into the hole as possible to take advantage of ground heat.

How much hold back should be increased in DTH drilling?

Hold back should be increased more and more as additional rods are added and as drilling progresses. DTH drilling is primarily percussive drilling using the energy imparted by the hammer piston to the rock through the bit. Any attempts to apply too much weight could damage the bit, hammer and drill string and impair the drilling rate.
