What are mining drilling rigs used for?

Mining drilling rigs are used for two main purposes, exploration drilling which aims to identify the location and quality of a mineral, and production drilling, used in the production-cycle for mining.

What is a drill rig used for?

While drill rigs are essential for underground mining, they also play a significant role in surface mining operations. In surface mining, drill rigs are used for exploratory drilling, enabling mining companies to assess the potential of mineral deposits before committing to full-scale operations.

What type of drilling rig is used in underground mining?

Underground mining (hard rock) uses a variety of drill rigs dependent on the desired purpose, such as production, bolting, cabling, and tunnelling. In early oil exploration, drilling rigs were semi-permanent in nature and the derricks were often built on site and left in place after the completion of the well.

How do drill rigs work in underground mining?

In underground mining, drill rigs are indispensable for creating blast holes that enable the controlled use of explosives to break rock. In underground mining, drill rigs are used extensively to create holes for blasting. This process begins with careful planning and assessment of the geological features of the mining site.

What is a small mobile drilling rig?

Small mobile drilling rigs are also used to drill or bore piles. Rigs can range from 100 short tons (91,000 kg) continuous flight auger (CFA) rigs to small air powered rigs used to drill holes in quarries, etc. These rigs use the same technology and equipment as the oil drilling rigs, just on a smaller scale.

What makes a good drilling rig?

The answer lies in drilling rigs--massive machines designed for precision, power, and endurance. But what makes one rig better for an offshore project and another ideal for land drilling? What factors should you consider when choosing the right rig for your job? It's not just about drilling deep.
