What is the purpose of a drilling rig?

The purpose of a drilling rig is only to drill a hole in the ground. Although the rig is big, the hole it drills is relatively small. The purpose of the drill hole is to tap an oil or gas reservoir often thousands of feet or hundreds of metres below the surface of the earth.

How does a drill rig work?

A drive train which consists of gears or hydraulic pumps is used to convert the power supply to speed and torque for hoisting and rotating the drilling equipment. Most units have a transmission which allows 4 to 8 speeds for hoisting and drilling. In general, the hoisting capacity of the drill rig governs the depth of the borehole.

What is a land drilling rig design?

This is a key feature in modern land drilling rig manufacturing. In addition to that, this rig design features a wide work area with large space for rig equipment. This allows for faster and better automation of the drilling process while keeping personnel safer at reduced risk.

What is a rotary drill rig?

Rigs equipped for reverse circulation must have a large rotary table opening that will allow the passage of 10- to 15-cm- (4- to 6-in.-) diam flange-connected drill pipe. A number of other types of rotary drill rigs are available, depending on the requirements of the drilling operations.

What is a drilling rig structure?

In general, a drilling rig structure includes the following types of loads: Dead Load: they could include the weight of crown, traveling block hook, top drive and guide rail, racking platform and mast. Besides weight of the mast, other loads are

What should be considered when designing a drill rig & circulation system?

Besides the work areas required for the drill rig and circulation system, consideration should also be given to the storage and/or stacking of drill rods, casing, and other miscellaneous equipment as well as work areas for inspection, logging, and temporary storage of samples.
