

Which air/oil separator is suitable for oil-cooled screw compressors?

The air/oil separator AOS XT is suitable for use in oil-cooled screw compressors. AOS XT separators provide robust performance under a wide range of operating conditions. The improved separation performance significantly reduces the oil discharge and thus lowers the operating costs of the compressor.

How to select the oil fine separator for a screw compressor?

In order to reduce the pressure loss and improve the separation efficiency when the air flows through the oil fine separator, the air flow rate should not be too high. However, the lower the air flow rate, the more filter materials are required.

How does a compressor lubricant separator work?

After the air is compressed an air/oil separator separates compressed air from compressor oil. The compressor lubricant collects at the bottom of the separator tank and the compressed air continues to the air receiver. A standard rotary screw separator reduces the lubricant entrained in the compressed air to 2-3 ppm.

What is rotary screw air compressor oil separator?

5. Initial pressure differential less than 0.02 Mpa. 6. Filter element of air oil separator is made by the thin fiberglass, which imported from HV&Lyd. Lubricated rotary screw air compressors mix oil with the intake air to lubricate the compressor's screws. After the air is compressed an air/oil separator separates compressed air from compressor oil.

What is an air compressor oil separator?

An air compressor oil separator is a key component in determining the air quality within a compressed air system. Oil, if able to get down your lines and reach your pneumatic tools, may cause serious damage and reduce your tools lifespan. Below we will take a look at oil separators: what they are, how they work and where you can find them!

What is the pressure drop through a oil-gas separator?

Generally, the pressure drop through a clean oil fine separator is around 0.025 - 0.03 Mpa, and for oil injected screw air compressors, the air flow velocity through the filter material should be around 0.1 m/s. The volume of the oil-gas separator is generally about three times that of the oil fine separator. Previous 12.
