How does a rig Drill work?

Drilling, grouting and anchoring becomes one continuous operation carried out with one piece of equipment. The same rig drills in soil or underlying rock. The hollow anchor rod fitted with a drill bit, is sunk by a water-flushed rotary drill at an angle of 45° to the horizontal.

How does a well drill work?

During this process, the driller will continuously take soil samples to monitor the geology encountered. When a water bearing formation is found, the well casing and stainless steel screen are installed. The well is then developed until there is an adequate supply of clean water.

How does drilling fluid work?

The entire drilling fluid system is a recycling loop where cuttings are first removed from the borehole. Then the drilling fluid is cleaned before being used in the borehole again. Over the years, the science of drilling fluid has improved significantly. Each type of soil can be matched to the most appropriate drilling fluid for that project.
