How do you drill a deep hole in a rock drill?

When drilling deep holes, must use different lengths drill rods of different lengths, and use short drill rods at the beginning. The air leg rock drill consists of two main parts, a jack hammer head and an air leg. The jack hammer head consists of a silencer, a motor, a water chamber, a motor control valve, and an air leg control valve.

What is air leg Rock Drill?

Air leg rock drill is a tool work in quarrying, construction and mining, which uses compressed air to drive rock drilling tools for rock drilling operations. This type of rock drill machine usually consists of a compressed air source, the rock drill body and the drilling bit.

Why do we use air while drilling?

So why use air while drilling? With air drilling bits, 20 to 30 percent of the air supplied for flushing the drilled rock out of the borehole is actually diverted around the nozzles in the drill bit to cool the bearings of the drill bit. Each roller cone has its own bearing that heats up under pressure and friction loads while drilling the rock.

How to fix a rock drill?

When fixing the rock drill, the pneumatic drill driver and drill operator should coordinate with each other and work closely together. After finishing the drilling, need to close the water valve first and run the pneumatic drill without load to blow away the remaining water droplets inside and prevent the parts from rusting.

What is a rock drill machine?

This type of rock drill machine usually consists of a compressed air source, the rock drill body and the drilling bit. During operation, compressed air is transported into the main body of the rock drill through pipelines.

How does air drilling work?

When drilling with air, the cuttings are carried up the annular space around the drill pipe by the buoyant effect of the air rushing to the surface. The benefits of drilling with air over mud is the faster speed of lifting the cuttings to the surface. Recommended bailing velocity of air drilling is 3,000 - 7,000 feet per minute.
