

How to deal with oil inflow into the screw air compressor gauge

What should I do if my rotary screw air compressor is flooded?

The coolers, plugs and separators become restricted, which could lead to an air compressor "heart attack." To avoid such a catastrophe, Sullair recommends these best practices for maintaining the longevity of your oil flooded rotary screw air compressor: Oil Sampling: This is a commonly overlooked component of good air compressor maintenance.

Does an oil flooded rotary screw air compressor need maintenance?

An oil flooded rotary screw air compressor is a lot like the human body. It requires routine upkeep and regular checkups to make sure it's functioning as it's supposed to. To avoid any problems, Sullair recommends the following best practices to maintain the longevity of your industrial air compressor.

Why do rotary screw air compressors need lubrication?

For instance, while a heart pumps blood to keep the body functioning, an oil flooded rotary screw air compressor circulates lubricants to keep the machine operating. Without proper lubrication, the air end -- the air compressor's heart -- is threatened with high heat, higher energy costs, and lower efficiency.

What happens if a compressor runs unloaded?

When the compressor runs unloaded, it is still running, but it is not actively pumping air or building any pressure. The inlet valve is closed, so no 'fresh' air can be sucked in. The screw element is turning but not taking in any new air.

How to check air compressor oil level?

Adjust the oil level to the manufacturer's recommended level. Use the dipstick provided with the air compressor to check the oil level accurately. 2.

How does a rotary screw air compressor stop?

To explain what happens, let's first look at how things should normally work. A normal stop procedure for a rotary screw air compressor (without vomiting back the oil!) looks like this: 1) Compressor runs loaded 2) Compressor runs unloaded 3) Compressor Stops New compressors will automatically first switch to 'unload' before completely stopping.
