

How to install the rotary head on a rock drill

Do you need a rotating drilling head?

You must use a rotating drilling head when drilling with air or gas or underbalanced drilling. The rotating head can be defined as a rotating, low-pressure sealing device used in drilling operations to seal around the drill stem above the top of the blowout preventer stack.

How do I protect my rotary head during drill operation?

Keep cab windows and doors closed during drill operation. Stay clear of the drill discharge area during drill operation. When the rotary head assembly is raised and lowered on the mast, the head can come into contact with other mast components and machine components.

What is a rotating drilling head?

Rotating drilling heads are used to safely divert air, gas, dust, or drilling mud away from the rig floor. The head has a rubber device called a stripper rubber that provides a continuous seal around the drill stem components, thus directing the drilling medium through a side outlet on the body and away from the rig floor.

What are Tei rock drills rotary heads?

TEI Rock Drills manufactures robust hydraulic rotary heads that are designed for smooth operation and simple maintenance in rotary drilling applications such as soil nailing and micropile operations. Our RDS heads go through the same bench testing procedure prior to delivery as our patented hydraulic drifters.

What should I do if a rotary head is damaged?

Ensure that all mast components and obstructions are cleared from the rotary head path before raising or lowering the rotary head on the mast. Damage may occur to mast components or machine components that are in the path of the rotary head travel. Do not allow personnel near a rotating drill pipe.
