What control methods are used in air compressors?

When it comes to air compressors, the control methods employed can significantly impact the overall operating efficiency. There are several control methods used in the compressor industry. These control methods are designed to optimize performance and energy consumption. Let's explore these methods in detail.

## 1. Inlet valve modulation

Why does a compressor draw less air?

This causes the compressor to draw in less air, matching compressor capacity with air usage for relatively steady pressure control. However, this also causes the compressor to draw a vacuum at the inlet, so that it is trying to make high pressure from a lower starting pressure. This causes part-load performance to be very poor.

Why does a modulating compressor have a poor performance?

This causes part-load performance to be very poor. A modulating compressor operating at 0 capacity still uses about 70% of its full load power. A modulating compressor can typically regulate discharge pressure with no or minimal air receiver storage.

How does receiver volume affect compressor efficiency?

For this reason, the efficiency of these compressors is greatly affected by the amount of receiver volume present in the system, as well. More receiver volume allows longer unloaded periods with lower power consumption. In addition, more receiver volume causes the compressor to cycle less, reducing wear and tear on the machine.

How much power does a modulating compressor use?

A modulating compressor operating at 0 capacity still uses about 70% of its full load power. A modulating compressor can typically regulate discharge pressure with no or minimal air receiver storage. Some modulation-controlled machines may be adjusted to fully unload or "blow down" if capacity reduces to a certain level, such as 40%.

How does lubricated screw compressor work?

Once a lower load (cut-in) pressure is reached, the compressor returns to full capacity, and the cycle repeats. During the unload period, the compressor reaches a low unloaded power consumption (approximately 25 to 30% of full load for lubricated screw compressor).
