

How to use the rotator of down-the-hole drill

How does a DTH drill work?

DTH equipment consists of a drilling hammer and a piston-powered by compressed air. As the drill string rotates, the drilling hammer strikes down on the rock. The drill bit receives its striking power from a piston inside the hammer that is powered by compressed air.

How does a down-the-hole drill work?

Down-the-hole drills consist of various components such as hammers, bits, and pipes that work together to create boreholes. The hammer delivers rapid blows to the bit, while air pressure removes debris from the hole. These tools are designed to withstand high-impact forces and provide exceptional performance in challenging environments.

What is down-the-hole (DTH) drilling?

Down-the-hole (DTH) drilling has made it easier for contractors to drill wells faster and more efficiently, and to transition from dirt boring to rock boring just by adding a compressor and hammer to the drill bit.

What is rotary drilling?

Rotary drilling is a versatile method for blast hole drilling, particularly for holes larger than 203 mm (8") in diameter. In softer rock formations, it is the most common method for drilling smaller holes.

What are down-the-hole drilling tools?

Down-the-hole drilling tools are essential for various industries such as mining, construction, and oil and gas exploration. These tools are versatile and can be used for a wide range of applications, from creating blast holes in quarries to installing water wells.

How does a drill hammer work?

As the drill string rotates, the drilling hammer strikes down on the rock. The drill bit receives its striking power from a piston inside the hammer that is powered by compressed air. This action along with the rotational movement of the drill string crushes the rock efficiently.
