

Jinyuan screw air compressor lubricating oil

What is rotary screw air compressor oil?

Air compressor oil plays several vital roles within a rotary screw air compressor system: Rotary screw air compressors are sometimes "oil flooded" or "oil injected," describing that oil is injected into the rotor housing. The oil mixes with the air during compression but is separated back out before the compressed air leaves the system.

Why is lubricant important in rotary screw compressors?

Lubricant is a critical component in rotary screw compressors. Understanding the characteristics of lubricant types helps ensure their proper application and increases customer satisfaction by extending the service life of compressors.

How long do rotary screw compressor lubricants last?

Varnish and other unwanted substances quickly follow. With regular mineral oils, this process can begin after only one to two thousand hours in a rotary screw compressor. Synthetic lubricants are more stable than natural mineral oils and oxidize more slowly. Most full synthetics have an 8000-hour service life rating or more.

What lubricants are used in compressors?

FIGURE 1: there are seven basic types of lubricants used in compressors today. Synthetic hydrocarbon lubricants are engineered for particular applications. For compressor applications, polyalphaolefin (PAO) base stock is most commonly used. PAOs provide many of the best lubricating features of a mineral oil without the drawbacks.

How does an air compressor lubricant valve work?

When the air compressor is first started, and the oil is cold, this valve will direct our oil straight into the air end and bypass the oil cooler. This will ensure the lubricant heats up quickly and can effectively perform all the tasks we demand of it.

How much water is in a compressor lubricant?

Water content of 1000 ppm or more is not uncommon in operating compressors. Water can be present in a compressor's lubricant circuit in both a dissolved state and a free state. Lubricants, like air, have a saturation point. Depending on the type of lubricant, a certain amount of water will be dissolved in the fluid.
