What type of rock is in the Montney Formation?

The Montney is a NW-SE trending, lens-shaped formation that straddles the border between British Columbia and Alberta. The map below illustrates the major rock types throughout the Montney Formation. Along the eastern edge, the Montney Formation includes shallow-water marine interbedded sandstone and siltstone.

How thick is the Montney Formation?

It was during these exploration ventures that the Montney Formation was discovered. It was found that this carpet of natural gas is quite thick, approximately 100m to 300m in thickness but it tends to get thin towards the northeastern and eastern borders of the formation.

How much gas is drilled in the Montney Formation?

Description: This graph shows the average, monthly production for gas wells drilled in the Montney Formation from 2001 to 2017. Production from wells drilled from 2001 to 2006 peaks at about 0.8 million cubic feet per day (MMcf/d) in its 2nd or 3rd month before declining to about 0.2 MMcf/d after 60 months.

Is Montney a marketable oil rig?

The Montney formation's marketable, unconventional petroleum potential has been evaluated for the first time in a joint assessment by the National Energy Board, the British Columbia Oil and Gas Commission, the Alberta Energy Regulator, and the British Columbia Ministry of Natural Gas Development.

Where are Montney wells drilled?

The map also shows the location of Montney wells drilled since 2005, which are largely located on the Montney's south and western sides. The Montney Formation is located in western Canada and has an area of 130 000 km², about the size of New Brunswick and Nova Scotia combined.

Which rigs are targeting the Montney shale?

Of Birchcliff's 25 horizontal wells, 24 wells are targeting the Middle/Lower Montney Play and one well is targeting the Basal Doig/Upper Montney Play. This is a snapshot of today's active rigs in the region where the Montney is typically the target formation. The Montney Shale possesses many attractive characteristics for exploitation, such as:

The Structure of the Montney Formation The Montney is a NW-SE trending, lens-shaped formation that straddles the border between British ...

As a result, each well is in contact with a larger volume of fractured rock and can flow more gas. Because of the large size of the Montney's core ...

The Montney formation has been the target of oil and gas exploration since the 1960s, and with 2023 being its
