What are the components of a drill rig?

Alternating current (AC), silicon controlled rectifier (SCR), direct current motor. The most widely used system on new rigs is the AC-SCR system. The drill string consists of: Drill Stem: is another term used in place of drillstring in some sources. It describes all the drilling components from the swivel down to the bit.

What size cylinder should a rock cylinder be?

The test specimen should be a rock cylinder of length-to-width ratio (H/D) in the range of 2 to 2.5 with flat, smooth, and parallel ends cut perpendicular to the cylinder axis. Originally, specimen diameters of NX size were used ( $D = 2\text{ in.} = 44\text{ mm}$ ), yet now the standard size is NQ core ( $D = 1\text{ in.} = 47.6\text{ mm}$ ).

How do you test a rock cylinder?

The test procedure is similar to the unconfined compression test for soils and concrete. The test specimen should be a rock cylinder of length-to-width ratio (H/D) in the range of 2 to 2.5 with flat, smooth, and parallel ends cut perpendicular to the cylinder axis.

How to determine strength classification of rock materials through an index test?

To determine strength classification of rock materials through an index test. Rock specimens in the form of core (diametral and axial), cut blocks or irregular lumps are broken by application of concentrated load through a pair of spherically truncated, conical platens. The distance between specimen-platen contact points is recorded.

How is rock strength determined in a laboratory?

The laboratory determination of intact rock strength is accomplished by the following tests: point load index, unconfined compression, triaxial compression, Brazilian test, and direct shear. The uniaxial (or unconfined) compression test provides the general reference value, having a respective analogy with standard tests on concrete cylinders.

How to determine uniaxial compressive strength of rock?

To determine the uniaxial compressive strength of rock ( $q_u = F_u = FC$ ). In this test, cylindrical rock specimens are tested in compression without lateral confinement. The test procedure is similar to the unconfined compression test for soils and concrete.
