MIT spin-off Quaise is trying to use hijacked fusion technology to drill some of the deepest holes in history, unlocking clean, virtually limitless, ...

Russian rock drill

An underground rocket or rocket drill is a device for rapidly drilling holes through soil and rock of varying composition at rates up to 1 metre per second by utilising supersonic jets of hot gases. It was developed by Russian engineer Mikhail Tsiferov in 1948. Proposed uses for the device included drilling shallow holes for mineral exploration, construction, underground gasification of coal, water and methane drainage.
