What should I do if my air compressor is too low?

If the capacity of the air compressor is really too low, check the following: Check differential pressure over oil separator. Replace separator when necessary. Check and replace compressed air filters (if installed). Compressor does not unload. Check if pressure switch is correctly set and working.

How do I know if my air compressor is working?

If you have a compressed air dryer, check the dewpoint. Check the current draw with a current clamp meter. If the motor draws excessive current: Try to turn the compressor by hand. It should be possible to turn it around. It should turn around smoothly, without any 'hiccups' (be sure to completely shut down the air compressor!).

What causes oil in compressed air?

Oil in compressed air can have various causes: Water is a natural by product of air compression. There will always be water in compressed air, unless we remove it. Check the condensate trap for good operation. There should be water coming out every few minutes. If you open up the manual drain, there should only a little water be coming out.
