What is rotary screw air compressor oil?

Air compressor oil plays several vital roles within a rotary screw air compressor system: Rotary screw air compressors are sometimes "oil flooded" or "oil injected," describing that oil is injected into the rotor housing. The oil mixes with the air during compression but is separated back out before the compressed air leaves the system.

How long do rotary screw compressor lubricants last?

Varnish and other unwanted substances quickly follow. With regular mineral oils, this process can begin after only one to two thousand hours in a rotary screw compressor. Synthetic lubricants are more stable than natural mineral oils and oxidize more slowly. Most full synthetics have an 8000-hour service life rating or more.

How does an air compressor heat a lubricant?

Ambient atmospheric air is heated by passing it across the system's aftercooler and oil cooler, where it extracts heat from both the compressed air and the lubricant. Rule of Thumb: A 50-horsepower compressor rejects heat at approximately 126,000 Btu per hour. Two fluids of different starting temperatures flow through the heat exchanger.

How do I change the oil on my air compressor?

When changing your air compressor's oil, follow the instructions in your manual. Although the basics of an oil change are simple--drain the old oil and then pour in new oil--the individual steps can be significantly more detailed. As an example, here are the steps required to change the oil in VMAC's G30 gas powered air compressors:

Do rotary screw compressors need lubricant?

Lubricant is a critical component in rotary screw compressors. Its condition is the key element in determining the service life of the machine, and it is constantly exposed to contamination. In order to maximize the service life of the compressor, follow these rules: Locate the compressor inlet to draw clean, cool air.

Why do air compressor lubricants oxidize?

Because they are mixed with air at high temperatures under pressure, all air compressor lubricants will oxidize eventually. The oxidation of lubricants produces a number of unwanted effects. As the lubricant begins to oxidize, organic peroxides will form. As the lubricant continues to oxidize, alcohols, ketones, and organic acids will form.
