

Screw air compressor overtemperature failure

What causes a screw air compressor to fail?

The repaired air compressor failures include, but are not limited to, high temperature, insufficient air pumping, overpressure of the main engine, overload of the motor, and excessive noise. Among them, the high temperature of screw air compressor is caused by many reasons, external and own reasons.

Why do screw air compressors have high temperatures?

Screw air compressors often have high temperatures in industrial production due to high ambient temperature, insufficient lubricating oil, radiator blockage and other problems, affecting the efficiency and life of the equipment.

Why is my rotary screw air compressor overheating?

Overheating in a rotary screw air compressor can be caused by faulty or poorly operating intake and exhaust systems and control pipes. This can be checked by looking at the alarm signal from the pressure switch, or by replacing it. Clogging of the separator affects air flow, resulting in excess internal pressure and therefore high temperature.

Why does my compressor trip on over temperature?

If your compressor trips on over temperature, it could be any of the following: Ambient temperature too high or not enough ventilation. A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand.

How to solve high temperature problem in air compressor?

To solve the high temperature problem, it is necessary to maintain stable operation of the equipment by improving the ventilation of the air compressor room, regularly checking the lubricating oil, cleaning the radiator, ensuring the normal operation of the temperature control valve, and replacing the oil filter.

What happens if air compressor temperature is too high?

It is specially reminded that if the operating environment temperature of the air compressor is too high, it will also cause the temperature of the equipment to increase. The solution is to use the exhaust fan duct to discharge heat and reduce the ambient temperature.
