

What is the normal operating temperature of an air compressor?

The normal operating temperature of an air compressor typically ranges between 75°C to 95°C. One of the common air compressor failure is overheating of the air compressor. For screw air compressors, operating temperatures exceeding 100°C will cause high-temperature alarms or shutdowns within the system.

Why does my compressor trip on over temperature?

If your compressor trips on over temperature, it could be any of the following: Ambient temperature too high or not enough ventilation. A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand.

What happens if air compressor temperature is too high?

It is specially reminded that if the operating environment temperature of the air compressor is too high, it will also cause the temperature of the equipment to increase. The solution is to use the exhaust fan duct to discharge heat and reduce the ambient temperature.

What causes a screw air compressor to fail?

The repaired air compressor failures include, but are not limited to, high temperature, insufficient air pumping, overpressure of the main engine, overload of the motor, and excessive noise. Among them, the high temperature of screw air compressor is caused by many reasons, external and own reasons.

Why is ambient temperature too high in air compressor?

External reasons 1). The ambient temperature is too high, because the higher the temperature, the thinner the air, resulting in a decrease in the working efficiency of the air compressor, making the air compressor more time in the loading state, carrying more load, and causing the air compressor to generate more heat.

Why is my rotary screw air compressor overheating?

Overheating in a rotary screw air compressor can be caused by faulty or poorly operating intake and exhaust systems and control pipes. This can be checked by looking at the alarm signal from the pressure switch, or by replacing it. Clogging of the separator affects air flow, resulting in excess internal pressure and therefore high temperature.
