What is steel casing drilling & rotary excavation?

Steel casing drilling and rotary excavation are carried out alternately, ensuring no hole collapse, no water leakage, and no waste of concrete when drilling into backfill soil layers, shallow sand and pebble layers, and limestone layers with many caves.

Are rotary drilling rigs good for hard rock drilling?

The rotary drilling rig rapidly popularized in the construction project because of its efficiency, quickness, environmental protection, good hole-forming quality and other advantages. But in drilling hard rock, there are some problems, such as low service life of key position, low construction efficiency and others.

What is a rotary drilling rig?

The drilling system is a combination of rotary drilling rig and gas lift reverse circulation drilling technology, which can realize continuous slag discharge in one drilling cycle of the drilling bucket. The key to the realization of this drilling method is the reverse circulation rock drilling bucket.

How can rotary drilling rigs be multi-functional?

The multi-functional application of the rotary drilling rig can be realized by adopting the modular design method, and the key of the modular design lies in the design of each functional interface.

Why is rotary drilling rig not suitable for hard formation condition?

Especially the main working device (power head, drill pipe, drill bucket etc.) of rotary drilling rig cannot adapt to the operating requirements of hard formation condition, which are mainly reflected in the weak strength of key parts, low service life and so on.

What is the rotary drilling process?

The rotary drilling process comprises several essential steps: Ground investigation: Before work begins, a geotechnical investigation is carried out to analyze the ground conditions and select the appropriate drilling technology.
