

What oil should be added to the screw air compressor separator

What kind of oil does a rotary screw air compressor use?

Generally, rotary screw air compressors use synthetic oil, while recreational compressors may use standard oil. Air compressor oil varies in composition and color but is often yellow or light brown and becomes darker as it becomes contaminated over time. Why do rotary screw air compressors need oil?

What is an air compressor oil separator?

An air compressor oil separator is a key component in determining the air quality within a compressed air system. Oil, if able to get down your lines and reach your pneumatic tools, may cause serious damage and reduce your tools lifespan. Below we will take a look at oil separators: what they are, how they work and where you can find them!

Where is the oil separator located on a rotary screw compressor?

Air-oil separators typically used on rotary screw compressors, are located just after the compressed air leaves the compressor, installed in the compressor's discharge line. This is so the oil can be removed and recycled back into the lubrication process.

What is an oil separator & how does it work?

An oil separator does exactly what its name tells you...it's a filter within an air compressor system that separates oil from the compressed air to protect system components and your air tools at the end of the line. If oil were to reach your pneumatic devices, serious damage could be caused which will result in short lifespan and greater costs.

Do air compressors use oil as lubricant?

As not all air compressors use oil as a lubricant, but in this case, imagine a rotary screw compressor which is very dependent on oil lubricant. So after this compression, a mixture of compressed air and oil is prevalent.

How do oil-free air separators work?

Separated Oil Return- Collected oil from separators' bottoms flow back via dedicated return lines into compressor sumps recycling them maintaining lubrication and cooling within compressors. Clean Air Output- Before delivery to your application, oil-free air leaving separators go through further filtration stages if required.
