

What s wrong with the down-the-hole drill not supplying oil

How much oil should a drill Hammer use?

On occasion, excess oil will drain down the drill rods into the hammer when it is not in use, and may demand a cleaning of the parts. Also, when using the hammer in cold and wet conditions, place it as far into the hole as possible to take advantage of ground heat. If parts are new, use an extra quart of oil per new joint of drill pipe.

Why does a stock block have two oil holes?

If you look at a stock block you would see that the two oil holes are side by side and the main oil hole is pretty much parallel to the cam feed hole making this a none issue. For some reason dart moved it away from the cam feed hole and off to the side so when you put the upper bearing in, it blocks most of the main feed hole.

What causes a drilled hole to become unstable?

Borehole instability occurs when the walls of the drilled hole become unstable or prone to collapse. This can happen due to various reasons such as changes in formation pressure, the presence of weak or fractured rocks, or inadequate drilling fluid properties.

What causes poor hole cleaning?

Poor hole cleaning can result from factors such as inadequate fluid velocity,improper mud rheology,or formation characteristics. It can lead to increased drilling time,higher drilling costs,and risks of equipment damage or stuck pipe.

What are wellbore problems in drilling?

Wellbore problems in drilling refer to challenges or complications encountered while drilling the wellbore,which is the hole drilled into the earth to extract oil,gas,or other resources. These problems can arise from various factors such as geological formations,fluid properties,or equipment limitations. 3. Borehole Instability
