What lubricant should a rock drill use?

Proper rock drill oil selection is the most important maintenance factor in achieving trouble-free drill operation. Higher productivity, less repair expense and improved driller safety are all benefits of selecting a high quality lubricant. A minimum oil viscosity of ISO 100 (SAE Grade 30) should be used for any rock drill application.

How does oil flow affect rock drill lubricants?

Excess oil flow contaminates the material being drilled, may affect the outcome of assays, and pollutes the environment. Rock drill lubricants are subjected to one of the most difficult environments (dust, dirt, moisture) and severe operations encountered in any other lubricant application.

Why should you use monolec rock drill oil?

Lack of, or poor quality lubrication will result in weakening of the metal through corrosive attack, progressively increasing the vulnerability to stress failure. MONOLEC Rock Drill Oils contain an additive to enhance adhesion to metal parts as well as an emulsifying agent to enhance its performance where moisture is present.

What is the minimum oil viscosity for a rock drill?

A minimum oil viscosity of ISO 100 (SAE Grade 30) should be used for any rock drill application. Larger, heavily loaded rock drills operating at elevated temperatures should use oil with a viscosity of ISO 220 (SAE grade 50). The oil must be specified for use in rock drill applications and must contain an extreme pressure additive.

Can I use a rock drill oil with a hydraulic hammer?

LE's 6303 (ISO 100) or LE's 6305 (ISO 220) can be used with peace of mind in achieving optimum rock drill performance with a minimum of wear. Drills with hydraulic hammers should use LE's MONOLEC Hydraulic Oils or LE'S MULTILEC Industrial Oils in the hydraulic actuators. Do Not Use a rock drill oil in a hydraulic hammer application.
