

Which down-the-hole drill chain is better

What is down the hole hammer drilling?

With Down-The-Hole (DTH) 1 drilling, the hammer sits right above the bit, like a drummer striking the right note. This position saves energy and transfers it efficiently to the rock below. When I first tried Top Hammer 2 drilling, the impact force starting at the top challenged my patience and accuracy.

Which drilling method is best for deep holes?

In DTH drilling, the hammer is positioned above the bit, minimizing energy loss. Top Hammer drilling is most efficient beyond 20 meters depth. False Top Hammer drilling is less efficient for deeper holes due to energy dissipation. Which Drilling Method is Better for Deep Holes?

Should I use DTH or top hammer drilling?

Deciding between DTH and Top Hammer drilling feels like choosing the correct tool. The choice depends on the rock type. Matching the method to the rock type truly matters. DTH drilling suits very hard and abrasive rocks with a hardness over 200 MPa. Top Hammer performs well in cohesive and stable formations with hardness below 200 MPa.

Does top hammer drilling work?

The hammer close to the bit means even really hard rocks did not stop us. On the other hand, Top Hammer drilling is less efficient for deep holes because of energy loss over long rods. But it works very well for surface tasks requiring speed and mobility. Imagine drilling in tough rock conditions over 30 meters deep.

What is the difference between top hammer & false top hammer drilling?

DTH drilling's percussive action occurs at the bottom, reducing noise. Top Hammer drilling is more energy efficient. False Top Hammer has lower energy efficiency compared to DTH drilling.

What is down-the-hole drilling?

In drilling operations, the spot where impact force hits may be the key to a smooth project or a problematic one. With Down-The-Hole (DTH) 1 drilling, the hammer sits right above the bit, like a drummer striking the right note. This position saves energy and transfers it efficiently to the rock below.

It's important to pick the rock drill that is most suitable for the type of drilling conditions that will likely be encountered, which starts with understanding the difference ...

Insufficient air: for Top Hammer < 15 m/s, for DTH (Down The Hole) < 15 m/s. Too much air: for Top Hammer > 30 m/s; for DTH > 60 m/s. More articles:
