

What are drilling parameters?

Drilling parameters play a large role in helping drillers achieve superior drilling performance and long equipment life. They are basic recommendations that help guide a driller avoid burning core bits or damaging other drilling equipment, and help achieve a good rate of penetration and core recovery.

What factors affect drilling parameters?

There is a clear relationship between the drilling parameters and all other factors in drilling, such as the diameter of the equipment you're using, rock hardness or ground variability. We have seen that when drilling conditions change, drillers will adjust their drilling parameters.

What are the testing process and drilling parameter determination?

The testing process and drilling parameter determination are consistent with that of the third test set as described in Sections 5 Third test set and results for drilling rock with constant rotation speed, 6 Third test setup and result for drilling rock with constant thrust force. The test results are summarized in Table 5.

What are the time series results of drilling parameters?

Time series results of drilling parameters from third test set of constant rotation speed for limestone sample: (a) Constant rotation speed (RPM = 220 r/min) drilling test result on a limestone sample, (b) Process 1 non-constant acceleration due to increase of  $F_t$  and  $T$ , and (c) Process 3 increase of  $F_t$  leads to increase of  $T$ . 5.2.

Does drilling speed affect rock resistance to drilling?

The drilling speed as the bit advancement into new rock material with unit time can be a measure for the rock resistance to drilling. Wang et al. (2024) expanded the DPM application to quantify the in situ strength development of soft soil grouted with permeable polyurethane.

What is a hydraulic rotary drilling machine?
